

# Authentication

(>= EZP 5.3, >= EZP Community 2014.01)

- Authentication using Symfony Security component
  - Security controller
    - Redirection after login
  - Configuration
  - Access control
  - Remember me
  - Login handlers / SSO
  - Integration with Legacy
- Authentication with Legacy SSO Handlers
- Upgrade notes

## Version compatibility

This documentation page is compatible with **eZ Publish 5.3 / 2014.01**

Prior to these versions, authentication was made through legacy stack only, using the venerable `user/login` module, with the help of a `PreAuthenticatedProvider`.

## Authentication using Symfony Security component

Native and universal `form_login` is used, in conjunction to an extended `DaoAuthenticationProvider` (DAO stands for *Data Access Object*), the `RepositoryAuthenticationProvider`. Native behavior of `DaoAuthenticationProvider` has been preserved, making it possible to still use it for pure Symfony applications.

### Security controller

A `SecurityController` is used to manage all security related actions and is thus used to display login form. It is pretty straight forward and follows all standards explained in [Symfony security documentation](#).

Base template used is `EzPublishCoreBundle:Security:login.html.twig` and stands as follows:

```

{%
    extends layout %

    % block content %
        % block login_content %
            % if error %
                <div>{{ error.message|trans }}</div>
            % endif %

            <form action="{{ path( 'login_check' ) }}" method="post">
                % block login_fields %
                    <label for="username">{{ 'Username:'|trans }}</label>
                    <input type="text" id="username" name="_username" value="{{ last_username }}"/>

                    <label for="password">{{ 'Password:'|trans }}</label>
                    <input type="password" id="password" name="_password" />

                    <input type="hidden" name="_csrf_token" value="{{ csrf_token }}"/>

                {#
                    If you want to control the URL the user
                    is redirected to on success (more details below)
                    <input type="hidden" name="_target_path" value="/account" />
                #}

                <button type="submit">{{ 'Login'|trans }}</button>
            % endblock %
        </form>
    % endblock %
% endblock %

```

The layout used by default is `%ezpublish.content_view.viewbase_layout%` (empty layout) but can be configured easily as well as the login template:

### ezpublish.yml

```

ezpublish:
    system:
        my_siteaccess:
            user:
                layout: "AcmeTestBundle::layout.html.twig"
                login_template: "AcmeTestBundle:User:login.html.twig"

```

## Redirection after login

By default, Symfony redirects to the URI configured in `security.yml` as `default_target_path`. If not set, it will default to `/`.

This setting can be set by SiteAccess, via `default_page` setting.

## Configuration

To use Symfony authentication with eZ Publish, the configuration goes as follows:

## ezpublish/config/security.yml

```
security:  
    firewalls:  
        ezpublish_front:  
            pattern: ^/  
            anonymous: ~  
            form_login:  
                require_previous_session: false  
            logout: ~
```

## ezpublish/config/routing.yml

```
login:  
    path: /login  
    defaults: { _controller: ezpublish.security.controller:loginAction }  
login_check:  
    path: /login_check  
logout:  
    path: /logout
```

### Note

You can fully customize the routes and/or the controller used for login. However, ensure to match `login_path`, `check_path` and `logout.path` from `security.yml`.

See [security configuration reference](#) and [standard login form documentation](#).

## Access control

See the [documentation on access control](#)

## Remember me

It is possible to use the `remember_me` functionality. For this you can refer to the [Symfony cookbook on this topic](#).

If you want to use this feature, you must at least extend the login template in order to add the required checkbox:

```
{# your_login_template.html.twig #}  
{% extends "EzPublishCoreBundle:Security:login.html.twig" %}  
  
{% block login_fields %}  
    {{ parent() }}  
    <input type="checkbox" id="remember_me" name="_remember_me" checked />  
    <label for="remember_me">Keep me logged in</label>  
{% endblock %}
```

## Login handlers / SSO

Symfony provides native support for multiple user providers. This makes it easy to integrate any kind of login handlers, including SSO and existing 3rd party bundles (e.g. `FR3DLdapBundle`, `HWIOauthBundle`, `FOSUserBundle`, `BeSimpleSsoAuthBundle`...).

Further explanation can be found in the [multiple user providers cookbook entry](#).

## Integration with Legacy

- When `not` in legacy mode, legacy `user/login` and `user/logout` views are deactivated.
- Authenticated user is injected in legacy kernel.

## Authentication with Legacy SSO Handlers

To be able to use your legacy SSO (Single Sign-on) handlers, use the following config in your `ezpublish/config/security.yml`:

### Use your legacy SSO handlers

```
security:  
    firewalls:  
        ezpublish_front:  
            pattern: ^/  
            anonymous: ~  
            # Adding the following entry will activate the use of old SSO handlers.  
            ezpublish_legacy_sso: ~
```

If you need to create your legacy SSO Handler, please read this entry

## Upgrade notes

Follow the notes below if you upgrade from 5.2 to 5.3 / 2013.11 to 2014.01

- In `ezpublish/config/security.yml`, you must remove `ezpublish: true` from `ezpublish_front` firewall.
- In `ezpublish/config/routing.yml`, you must add `login`, `login_check` and `logout` routes (see above in [Configuration])
- In your templates, change your links pointing to `/user/login` and `/user/logout` to appropriate `login/login_check/logout` routes:

*Before:*

```
<a href="{{ path('ez_legacy', {'module_uri': '/user/login'}) }}>Login</a>  
  
<form action="{{ path('ez_legacy', {'module_uri': '/user/login'}) }}" method="post">  
  
<a href="{{ path('ez_legacy', {'module_uri': '/user/logout'}) }}>Logout</a>
```

*After:*

```
<a href="{{ path('login') }}>Login</a>  
  
<form action="{{ path('login_check') }}" method="post">  
  
<a href="{{ path('logout') }}>Logout</a>
```
