

Step 2 - Display the list of Rides on the homepage

- 1 Customize your homepage template
- 2 Create your sub controller to display list of Rides
- 3 Create template to display the list of Rides
- 4 Use a custom template to display view line of a Ride

Tutorial path

| | Name | Starting Point | Length | Level |
|---|------------------|----------------|--------|-------|
|  | My first ride | Lyon | 20 Km | ★ |
| | My favorite ride | Lyon | 50 Km | ★★ |
| | Afternoon ride | Lyon | 80 Km | ★★★ |
| | Col du Chamois | Lyon | 60 Km | ★★★ |

« 1 2 3 4 5 »

Customize your homepage template

Let's modify the `Resources/views/content/full/root_folder.html.twig` adding a call to a subrequest to display the list of all existing Rides with pagination:

root_folder.html.twig

```
{% extends "pagelayout.html.twig" %}

{% block content %}
    <script
    src="http://maps.google.com/maps/api/js?sensor=false"></script>

    <h3 class="center bottom-plus new-header">{{
    ez_content_name(content) }}</h3>
    <div class="col-xs-10 text-justified">
        {{ render( controller(
        "AppBundle:Homepage:getAllRides" ) ) }}
    </div>
{% endblock %}
```

For the moment, we use a simple `render()` Twig function but when we talk about cache, we will use `render_esi`.

Create your sub controller to display list of Rides

Create your `/src/AppBundle/Controller/HomepageController.php` with the method `getAllRidesAction`:

HomepageController.php

```
<?php
namespace AppBundle\Controller;
use eZ\Publish\API\Repository\Values\Content\Query;
use
eZ\Publish\API\Repository\Values\Content\Query\Criterion
;
use eZ\Publish\Core\MVC\Symfony\Controller\Controller;
use
eZ\Publish\API\Repository\Values\Content\Query\SortClas
e;
use
eZ\Publish\Core\Pagination\Pagerfanta\ContentSearchAdapt
er;
use Pagerfanta\Pagerfanta;
use Symfony\Component\HttpFoundation\Request;
class HomepageController extends Controller
{
    public function getAllRidesAction(Request $request)
    {
        $repository = $this->getRepository();
        $locationService =
$repository->getLocationService();
        $contentService = $repository->getContentService();
        $rootLocationId =
$this->getConfigResolver()->getParameter('content.tree_r
oot.location_id');
        $rootLocation =
$locationService->loadLocation($rootLocationId);
        $currentLocationId = 2;
        $currentLocation =
$locationService->loadLocation($currentLocationId);
        $currentContent =
$contentService->loadContentByContentInfo($currentLocati
on->contentInfo);
        $query = new Query();
        $query->query = new Criterion\LogicalAnd(
            array(
                new
Criterion\Subtree($rootLocation->pathString),
                new
Criterion\Visibility(Criterion\Visibility::VISIBLE),
                new
Criterion\ContentTypeIdentifier(array('ride'))
            )
        );
        $query->sortClauses = array(
            new SortClause\DatePublished(Query::SORT_ASC)
        );
        $pager = new Pagerfanta(
            new ContentSearchAdapter($query,
$this->getRepository()->getSearchService())
        );
        //FIXME : get $limit value from a custom parameter
        $limit = 10;
        $pager->setMaxPerPage($limit);
        $pager->setCurrentPage($request->get('page', 1));
        return $this->render(
```

```
'list/rides.html.twig',  
array(  
  'location' => $currentLocation,  
  'content' => $currentContent,  
  'pagerRides' => $pager,  
)
```

```
    );  
  }  
}
```

Create template to display the list of Rides

Create `app/Resources/views/list/rides.html.twig` template. You use a `<table>` to display the list of rides. The `<thead>` of the `<table>` is in this Ride list template and each `<tr>` (line of the table) is in the line ride template.

So each time you use the line Ride template, you have to remember the choice of using a `<tr>`.

rides.html.twig

```
<div class="row regular-content-size">  
  <div class="col-xs-10 col-xs-offset-1 box-style">  
    <h3 class="center bottom-plus new-header">List of  
all Rides</h3>  
    {# Loop over the page results #}  
    {% for ride in pagerRides %}  
      {% if loop.first %}  
        <table class="table table-hover">  
          <thead>  
            <tr class="table-header">  
              <th> Ride</th>  
              <th>From</th>  
              <th> To</th>  
              <th>Distance</th>  
              <th>Level</th>  
            </tr>  
          </thead>  
          <tbody>  
            {% endif %}  
            {{ render( controller( 'ez_content:viewLocation',  
{ 'locationId':  
ride.versionInfo.contentInfo.mainLocationId, 'viewType':  
'line' } )) }}  
            {% if loop.last %}  
              </tbody>  
            </table>  
            {% endif %}  
          {% endfor %}  
        </div>  
      </div>
```

The next step is to create the override rule to use a dedicated template for the view line of Rides.

To do so, you need to configure your Bundle to inject override configuration.

Use a custom template to display view line of a Ride

You add the rule for the `line_ride` template to be used in your `app/config/ezplatform.yml` file.

ezplatform.yml

```
system:
  site_group:
    content_view:
      line:
        line_ride:
          template: "line/ride.html.twig"
          match:
            Identifier\ContentType: "ride"
```

Create your `app/Resources/views/line/ride.html.twig` template.

Remember, it's only one line of a table, so you will find a `<tr>` tag with some `<td>` tags.

ride.html.twig

```
<tr>
  <td>
    <strong>
      <a href="{{ path( "ez_urlalias", {
'locationId': content.contentInfo.mainLocationId } ) }}"
        target="_self">
        {{ ez_content_name( content ) }}
      </a>
    </strong>
  </td>
  <td>
    {{ ez_render_field(content, 'starting_point',
{'parameters': {'width': '100%', 'height': '100px',
'showMap': true, 'showInfo': true }}
) }}
  </td>
  <td>
    {{ ez_render_field(content, 'ending_point',
{'parameters': {'width': '100%', 'height': '100px',
'showMap': true, 'showInfo': true }}
) }}
  </td>
  <td>
    <p>{{ ez_render_field( content, 'length' ) }}
Km</p>
  </td>
  <td>
    <p>{{ ez_render_field( content, 'level' ) }}</p>
  </td>
</tr>
```

Go to the homepage of your Tutorial website, and you will see the list of Rides !
